

Name - Hansika Kota

AI/ML Intern

AI/ML Internship - Pose Detection Project

Output Preview

The project successfully detects human body landmarks in real time using the webcam and displays a pose skeleton on the screen. The system tracks facial points, shoulders, arms, and upper body posture using AI-powered pose estimation. Shows Pose detected or not on the screen.

Features Demonstrated

- Real-time webcam pose detection
- AI landmark tracking using MediaPipe
- Skeleton structure visualization
- Live FPS display for performance monitoring
- Pose Detected status indicator
- Human body keypoint recognition

Sample Output

The application identifies body landmarks such as:

- Nose
- Eyes
- Shoulders
- Arms
- Upper body joints

Technologies Used

Python 3.11 MediaPipe 0.10.14 OpenCV 4.8.0.76 protobuf 4.25.3 numpy 1.24.3

What I Learned

Through this project, I learned how computer vision and AI can work together for real-time human pose detection. I understood how MediaPipe detects body landmarks and how OpenCV processes webcam frames for live visualization. This technology is widely used in fitness tracking, virtual try-on systems, motion analysis, and gesture recognition applications.
